

Cecilia Bergström is a committed researcher and clinician with a deep interest in women's health and musculoskeletal disorders. After earning her PhD from the Karolinska Institute in Sweden in 2011, she now serves as a Staff Scientist at Umeå University's Unit of Obstetrics and Gynaecology while continuing her chiropractic practice. Her research primarily focuses on persistent pelvic girdle pain (PPGP) postpartum, examining its long-term consequences and risk factors. As the principal investigator of a postdoctoral project at Umeå University, she conducted a comprehensive 12-year follow-up study on women affected by PPGP. From 2017 to 2024, Cecilia was the main data collection coordinator for Sweden and Tanzania in the Cross-Country Ultrasound Study (CROCUS), which investigated the ethical and clinical implications of obstetric ultrasound worldwide. Additionally, she leads the international research project "Musculoskeletal Complaints in Elders—Are Chiropractors an Untapped Resource?", exploring the role of chiropractors in managing musculoskeletal issues in older adults. With a dedication to bridging clinical practice and research, Cecilia is committed to advancing knowledge in chiropractic care, women's health, and interdisciplinary collaboration.
